

FORGE DIGITAL

Business Website Kit — START HERE

Welcome! You now have three ready-to-customize responsive website templates designed for businesses, stores, and restaurants.

1. What's Included

Template	Best For
AUREX	Agencies, consultants, professionals, service businesses
NOVA	Fashion brands, boutiques, shops, product businesses
SAVOR	Restaurants, cafés, food businesses, lounges

2. How to Open a Template

Open the template folder and double-click **index.html**. The website should open in your browser. You do not need a server just to preview the basic templates.

Keep **index.html**, **style.css**, and **script.js** in the same template folder unless you also update their file paths.

3. Change the Business Name

Open **index.html** in a code editor such as VS Code, PyCharm, or Notepad++. Use **Ctrl + F** to search for the demo brand name, then replace it with the customer's business name. Check the browser tab title and footer as well.

4. Change Text, Services & Prices

Search the HTML for the existing heading, description, service name, product name, or price. Replace the text while keeping the surrounding HTML structure intact. For NOVA and SAVOR, product/cart information is also stored in **script.js**, so update matching product names and prices there too.

5. Change Images

Each template currently uses image URLs. To use customer images, replace the URL inside an **** tag. If you download images into an **images** folder, a typical path is:

```
images/photo.jpg
```

Use appropriately licensed images. For commercial projects, make sure you have permission to use the photos, logos, fonts, and other assets.

6. Change the WhatsApp Number

For the interactive templates, open **script.js** and find the WhatsApp configuration. Replace the placeholder number with the business WhatsApp number in international format, without **+**, spaces, or dashes.

```
const WHATSAPP_NUMBER = "233XXXXXXXXX";
```

7. Change Colors

Open **style.css** and look near the top for **:root**. The CSS variables control the main colors. Change the hex values to match the customer's branding. Save the file and refresh the browser.

8. Publish for Free with GitHub Pages

- Create a GitHub repository and upload the template files.
- Make sure **index.html** is in the published folder.
- Open the repository's Pages settings and select the branch/folder you want to publish.
- Wait for GitHub Pages to deploy, then open the generated website address.

9. Using the Kit for Client Projects

Customize the design, text, images, colors, contact details, and business information for the client. Test every button and form on both desktop and mobile before delivery. Do not leave demo names, placeholder phone numbers, placeholder links, or sample testimonials in the final client version.

10. Quick Troubleshooting

Website looks unstyled	Check that style.css is in the same folder as index.html and that the HTML uses the correct path.
JavaScript does not work	Check that script.js exists and that the HTML points to the correct file path.
Images do not appear	Check the image URL/path and filename. Avoid spaces or incorrect capitalization in local filenames.
WhatsApp does not open	Check the number is in international format and contains digits only.
Cart is empty after refresh	The cart uses browser localStorage. Clearing browser site data can remove saved cart items.
Mobile menu does not work	Make sure script.js is loading and that the HTML class names match the JavaScript.

11. Before You Deliver a Website

- Test the homepage on phone and desktop.
- Test navigation links.
- Test WhatsApp/contact buttons.
- Test forms and required fields.
- Check every image.
- Check spelling and business information.
- Remove all demo content.
- Check social-media links.
- Check page title and description.
- Test the final published URL.

12. Important Notes

These templates are starting points. You can customize them for different industries and projects. Third-party image URLs, fonts, icons, and other assets may have their own terms or licenses. Verify the current license before using an asset in a commercial client project.

13. Forge Digital
